Assignment 6: GLMs (Linear Regressios, ANOVA, & t-tests)

Jackie Van Der Hout

OVERVIEW

This exercise accompanies the lessons in Environmental Data Analytics on generalized linear models.

Directions

1. Change "Student Name" on line 3 (above) with your name.
2. Work through the steps, **creating code and output** that fulfill each instruction.
3. Be sure to **answer the questions** in this assignment document.
4. When you have completed the assignment, **Knit** the text and code into a single PDF file.
5. After Knitting, submit the completed exercise (PDF file) to the dropbox in Sakai. Add your last name into the file name (e.g., "Fay_A06_GLMs.Rmd") prior to submission.

The completed exercise is due on Monday, February 28 at 7:00 pm.

Set up your session

1. Set up your session. Check your working directory. Load the tidyverse, agricolae and other needed packages. Import the *raw* NTL-LTER raw data file for chemistry/physics (`NTL-LTER_Lake_ChemistryPhysics_Raw.csv`). Set date columns to date objects.

2. Build a ggplot theme and set it as your default theme.

```
#1
getwd()
```

```
## [1] "C:/Users/Jackie/Box/Classes Spring 2022/Environmental Data Analytics/Environmental_Data_Analytic
```

```
library(tidyverse)
```

```
## -- Attaching packages --------------------------------------- tidyverse 1.3.1 --

## v ggplot2 3.3.5     v purrr   0.3.4
## v tibble  3.1.4     v dplyr   1.0.7
## v tidyr   1.1.4     v stringr 1.4.0
## v readr   2.1.1     v forcats 0.5.1

## -- Conflicts ------------------------------------------ tidyverse_conflicts() --
## x dplyr::filter() masks stats::filter()
## x dplyr::lag()    masks stats::lag()
```

```r
library(agricolae)
library(lubridate)
```

```
##
## Attaching package: 'lubridate'

## The following objects are masked from 'package:base':
##
##     date, intersect, setdiff, union
```

```r
NTL_LTER <- read.csv("../Data/Raw/NTL-LTER_Lake_ChemistryPhysics_Raw.csv", stringsAsFactors = TRUE)
NTL_LTER$sampledate <- as.Date(NTL_LTER$sampledate , format = "%m/%d/%Y")
class(NTL_LTER$sampledate)
```

```
## [1] "Date"
```

```r
#2
mytheme <- theme_classic(base_size = 14) +
  theme(axis.text = element_text(color = "black"),
        legend.position = "right")
theme_set(mytheme)
```

Simple regression

Our first research question is: Does mean lake temperature recorded during July change with depth across all lakes?

3. State the null and alternative hypotheses for this question: > Answer: H0: The mean lake temperature does not change with depth across all lakes, there is no difference. P-value greater than 0.05. Ha: The mean lake temperature is observed to change with depth across all lakes, there is a significant difference. P-value less than 0.05.

4. Wrangle your NTL-LTER dataset with a pipe function so that the records meet the following criteria:

- Only dates in July.
- Only the columns: `lakename`, `year4`, `daynum`, `depth`, `temperature_C`
- Only complete cases (i.e., remove NAs)

5. Visualize the relationship among the two continuous variables with a scatter plot of temperature by depth. Add a smoothed line showing the linear model, and limit temperature values from 0 to 35 °C. Make this plot look pretty and easy to read.

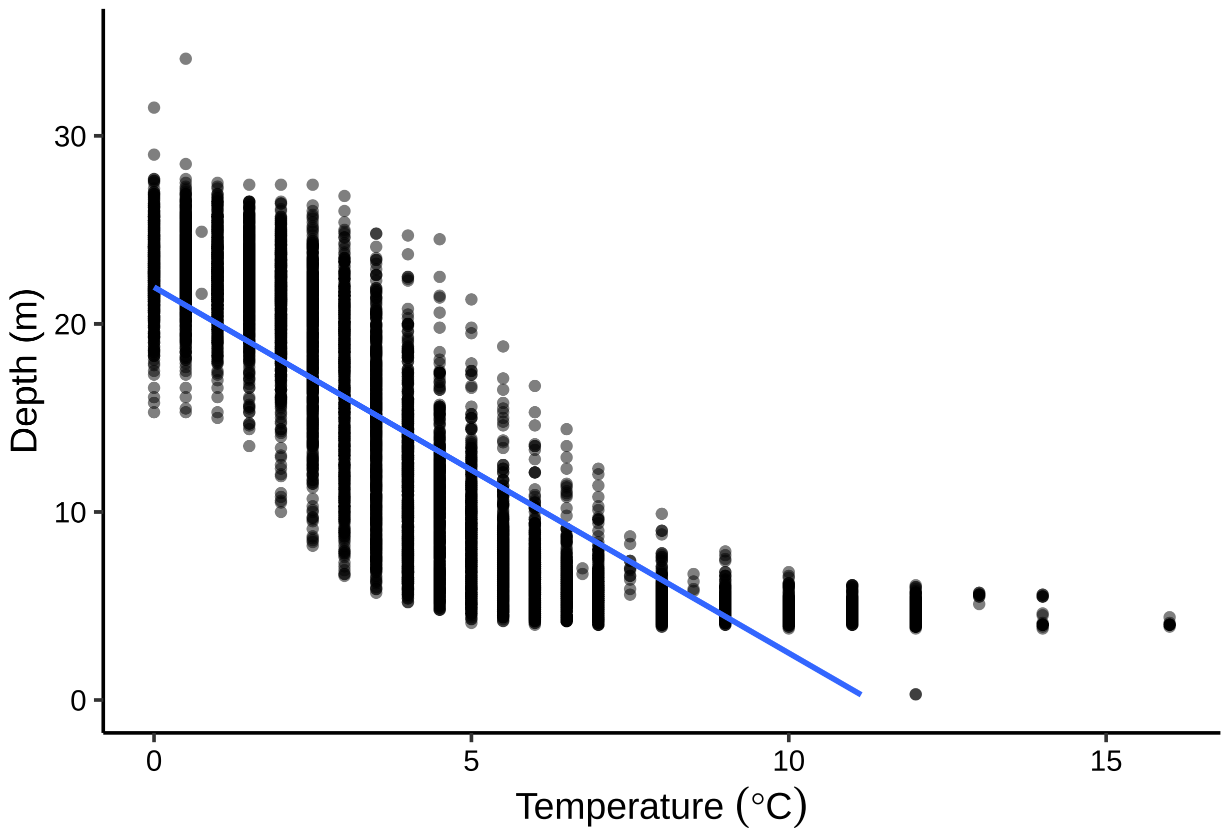
```r
#4
NTL_LTER <- NTL_LTER %>%
  mutate(samplemonth = month(sampledate)) %>%
  filter(samplemonth == 7) %>%
  select(lakename, year4, daynum, depth, temperature_C) %>%
  drop_na()

#5
```

```r
ggplot(NTL_LTER, aes(x = depth, y = temperature_C))+
  geom_point(alpha = 0.5)+
  geom_smooth(method = "lm", se = FALSE)+
  ylim(0, 35)+
  labs(x = expression("Temperature "(degree*C)), y = "Depth (m)")
```

```
## `geom_smooth()` using formula 'y ~ x'
```

```
## Warning: Removed 24 rows containing missing values (geom_smooth).
```



6. Interpret the figure. What does it suggest with regards to the response of temperature to depth? Do the distribution of points suggest about anything about the linearity of this trend?

   Answer: Temperature appears to be decreasing with depth, and the trend appears to be mostly linear with exceptions at deeper depths where there are also fewer datapoints.

7. Perform a linear regression to test the relationship and display the results

```r
#7
temp.depth <- lm(NTL_LTER$temperature_C ~ NTL_LTER$depth)
summary(temp.depth)
```

```
##
## Call:
## lm(formula = NTL_LTER$temperature_C ~ NTL_LTER$depth)
##
## Residuals:
##     Min      1Q  Median      3Q     Max
## -9.5173 -3.0192  0.0633  2.9365 13.5834
##
## Coefficients:
##                 Estimate Std. Error t value Pr(>|t|)
## (Intercept)    21.95597    0.06792   323.3   <2e-16 ***
## NTL_LTER$depth -1.94621    0.01174  -165.8   <2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 3.835 on 9726 degrees of freedom
## Multiple R-squared:  0.7387, Adjusted R-squared:  0.7387
## F-statistic: 2.75e+04 on 1 and 9726 DF,  p-value: < 2.2e-16
```

8. Interpret your model results in words. Include how much of the variability in temperature is explained by changes in depth, the degrees of freedom on which this finding is based, and the statistical significance of the result. Also mention how much temperature is predicted to change for every 1m change in depth.

   Answer: This model accounted for 73.87% of the variability within the temperature data by conducting a linear regression on depth. This finding is based on 9726 degrees of freedom, and has a statistically significant p-value of 2e-16. The change in temperature based on every 1m change in depth is the slope of the model, which is -1.94621 degrees/ meter.

Multiple regression

Let's tackle a similar question from a different approach. Here, we want to explore what might the best set of predictors for lake temperature in July across the monitoring period at the North Temperate Lakes LTER.

9. Run an AIC to determine what set of explanatory variables (year4, daynum, depth) is best suited to predict temperature.

10. Run a multiple regression on the recommended set of variables.

```
#9
NTLAIC <- lm(data = NTL_LTER, temperature_C ~ year4 + daynum + depth)
step(NTLAIC)#26065.53
```

```
## Start:  AIC=26065.53
## temperature_C ~ year4 + daynum + depth
##
##          Df Sum of Sq    RSS   AIC
## <none>                141687 26066
## - year4   1       101 141788 26070
## - daynum  1      1237 142924 26148
## - depth   1    404475 546161 39189
```

```
##
## Call:
## lm(formula = temperature_C ~ year4 + daynum + depth, data = NTL_LTER)
##
## Coefficients:
## (Intercept)        year4       daynum        depth
##    -8.57556      0.01134      0.03978     -1.94644
```

```
summary(NTLAIC)
```

```
##
## Call:
## lm(formula = temperature_C ~ year4 + daynum + depth, data = NTL_LTER)
##
## Residuals:
##     Min      1Q  Median      3Q     Max
## -9.6536 -3.0000  0.0902  2.9658 13.6123
##
## Coefficients:

## NTLAIC          5 53674.39
## temp.multiple  4 53679.36
```

```
#AIC with all variables is higher, so we keep all variables
#all p-values are low, so it is probably useful to include all of them

#10
#run regression with all variable
multiNTL <- lm(data = NTL_LTER, temperature_C ~ year4, daynum, depth)
summary(multiNTL)
```

```
##
## Call:
## lm(formula = temperature_C ~ year4, data = NTL_LTER, subset = daynum,
##     weights = depth)
##
## Weighted Residuals:
##     Min      1Q  Median      3Q     Max
## -18.888  -9.362   5.988  17.487  24.384
##
## Coefficients: (1 not defined because of singularities)
##             Estimate Std. Error t value Pr(>|t|)
## (Intercept)  8.72200    0.07221   120.8   <2e-16 ***
## year4             NA         NA      NA       NA
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 15.51 on 9072 degrees of freedom
```

11. What is the final set of explanatory variables that the AIC method suggests we use to predict temperature in our multiple regression? How much of the observed variance does this model explain? Is this an improvement over the model using only depth as the explanatory variable?

    Answer: The final set of explanatory variables is the full set, year4, daynum, and depth. The R^2 value for this model accounts for 74.11% of the variance within the data. This is a slight improvement over the 73.87% explanatory power of the previous model using only depth.

Analysis of Variance

12. Now we want to see whether the different lakes have, on average, different temperatures in the month of July. Run an ANOVA test to complete this analysis. (No need to test assumptions of normality or similar variances.) Create two sets of models: one expressed as an ANOVA models and another expressed as a linear model (as done in our lessons).

```r
#12
NTL_anova <- aov(data = NTL_LTER, temperature_C ~ lakename)
summary(NTL_anova)
```

```
##               Df Sum Sq Mean Sq F value Pr(>F)
## lakename       8  21642  2705.2      50 <2e-16 ***
## Residuals   9719 525813    54.1
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
```

```r
NTL_anova2 <- lm(data = NTL_LTER, temperature_C ~ lakename)
summary(NTL_anova2)
```

```
##
## Call:
## lm(formula = temperature_C ~ lakename, data = NTL_LTER)

##
## Residual standard error: 7.355 on 9719 degrees of freedom
## Multiple R-squared:  0.03953,    Adjusted R-squared:  0.03874
## F-statistic:    50 on 8 and 9719 DF,  p-value: < 2.2e-16
```

13. Is there a significant difference in mean temperature among the lakes? Report your findings.

    Answer: Yes, there is a significant difference (p = 2e-16) in mean tempearture between lakes. This leads to a rejection of the null hypothesis.

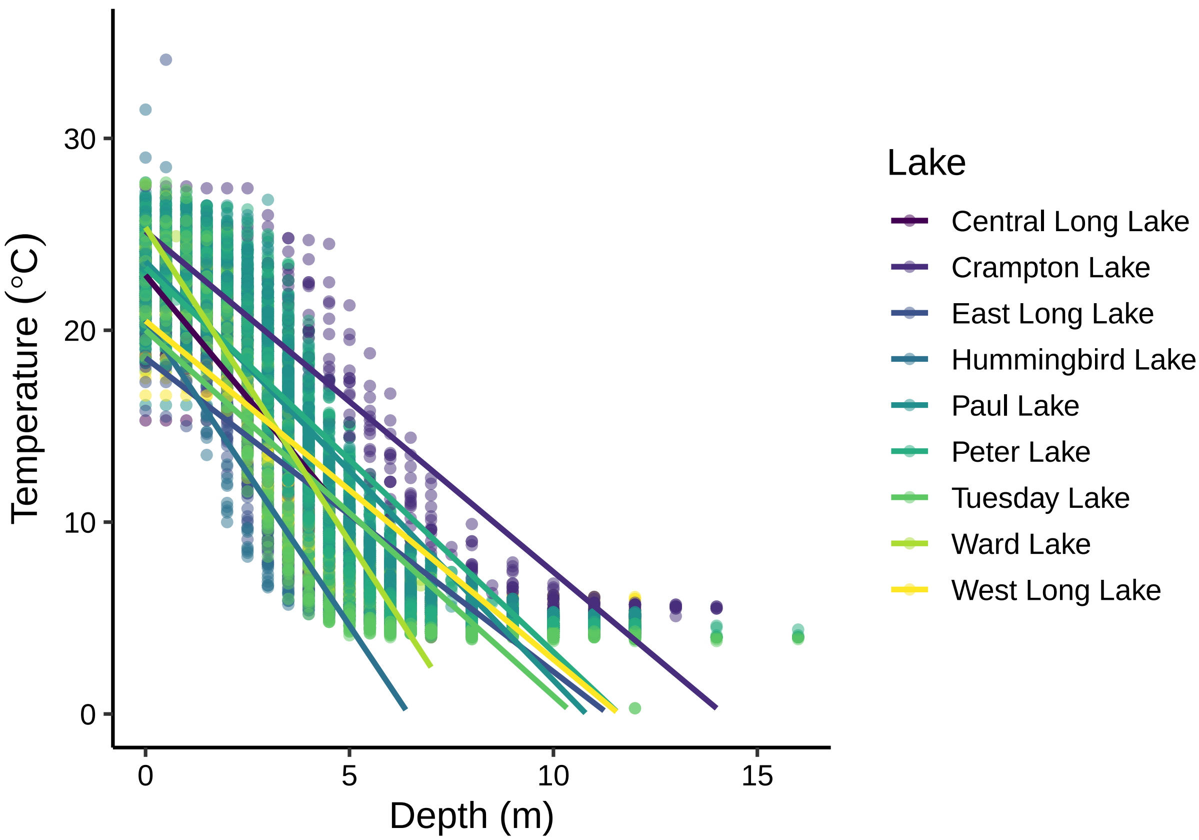
14. Create a graph that depicts temperature by depth, with a separate color for each lake. Add a geom_smooth (method = "lm", se = FALSE) for each lake. Make your points 50 % transparent. Adjust your y axis limits to go from 0 to 35 degrees. Clean up your graph to make it pretty.

```r
#14.
NTL_LTER.plot <- ggplot(NTL_LTER, aes(x = depth, y = temperature_C, color = lakename))+
  geom_point(alpha = 0.5)+
```

```
  geom_smooth(method = "lm", se = FALSE)+
  ylim(0, 35)+
  labs(x = "Depth (m)", y = expression("Temperature "(degree*C)), color = "Lake")+
  scale_color_viridis_d()
NTL_LTER.plot
```

```
## `geom_smooth()` using formula 'y ~ x'
```

```
## Warning: Removed 73 rows containing missing values (geom_smooth).
```



15. Use the Tukey's HSD test to determine which lakes have different means.

```
#15

TukeyHSD(NTL_anova)
```

```
##   Tukey multiple comparisons of means
##     95% family-wise confidence level
##
## Fit: aov(formula = temperature_C ~ lakename, data = NTL_LTER)
##
## $lakename
##                                           diff        lwr        upr     p adj

16.From the findings above, which lakes have the same mean temperature, statistically speaking, as Peter Lake? Does any lake have a mean temperature that is statistically distinct from all the other lakes?

> Answer: Lakes with similar mean temperature to Peter lake include Ward Lake and Paul Lake. All lakes share at least one statistically significant similarity with another lake.

17. If we were just looking at Peter Lake and Paul Lake. What's another test we might explore to see whether they have distinct mean temperatures?

> Answer: Paired T-test is a statistical test to compare two means, because there are just two lakes, this could be a good test to use.
